Impact des activités agricoles sur la qualité de l'air en lle-de-France

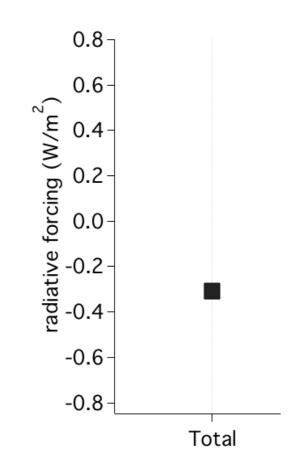

J.-E. Petit, V. Gros, P. Buysse, J. Kammer, F. Truong, S. Bsaibes, R. Sarda-Estève, D. Baisnée, N. Bonnaire, S. Cristescu, B. Henderson, O. Favez, T. Amodeo, F. Lafouge, R. Ciuraru, B. Loubet

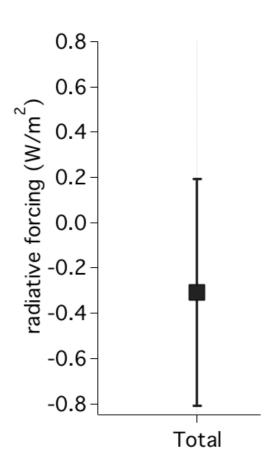

INTERACTIONS AÉROSOL - CLIMAT

- Absorption / Diffusion
- Forçage radiatif globalement négatif (-0.3 W/m²)...

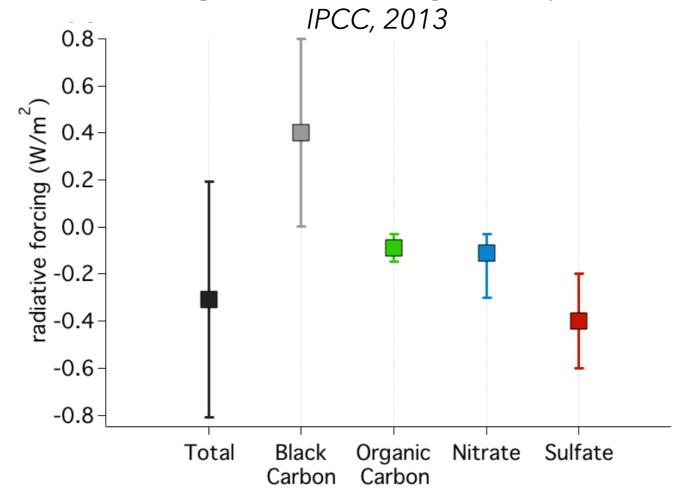

INTERACTIONS AÉROSOL - CLIMAT

- Absorption / Diffusion
- Forçage radiatif globalement négatif (-0.3 W/m²)... mais fortes incertitudes

INTERACTIONS AÉROSOL - CLIMAT

- Absorption / Diffusion
- Forçage radiatif globalement négatif (-0.3 W/m²)... mais fortes incertitudes
- Liées notamment à la composition chimique des particules

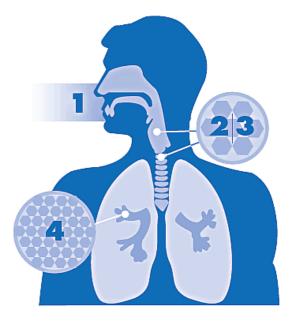

INTERACTIONS AÉROSOL - CLIMAT

- Absorption / Diffusion
- Forçage radiatif globalement négatif (-0.3 W/m²)... mais fortes incertitudes
- Liées notamment à la composition chimique des particules

SANTÉ

- Pollution particulaire: 1er risque environnemental dans le monde
- 48 000 morts prématurées / an en France
- Exposition chronique, accrue en zone urbaine
- Toxicité fonction de la composition chimique

- Particulate matter enters our respiratory (lung) system through the nose and throat.
- 2 3 The larger particulate matter (PM10) is eliminated through coughing, sneezing and swallowing.
 - 4 PM2.5 can penetrate deep into the lungs. It can travel all the way to the alveoli, causing lung and heart problems, and delivering harmful chemicals to the blood system.

INTERACTIONS AÉROSOL - CLIMAT

- Absorption / Diffusion
- Forçage radiatif globalement négatif (-0.3 W/m²)... mais fortes incertitudes
- Liées notamment à la composition chimique des particules

SANTÉ

LA COMPOSITION CHIMIQUE EN ÎLE-DE-FRANCE

Quel est l'impact des activités agricoles sur la qualité de l'air?

Séminaire de terrain pour la z5 cet après-midi venir me voir

ACSM

OM NO_3

SO₄²⁻ NH₄⁺

Cl-

AE33

Black Carbon

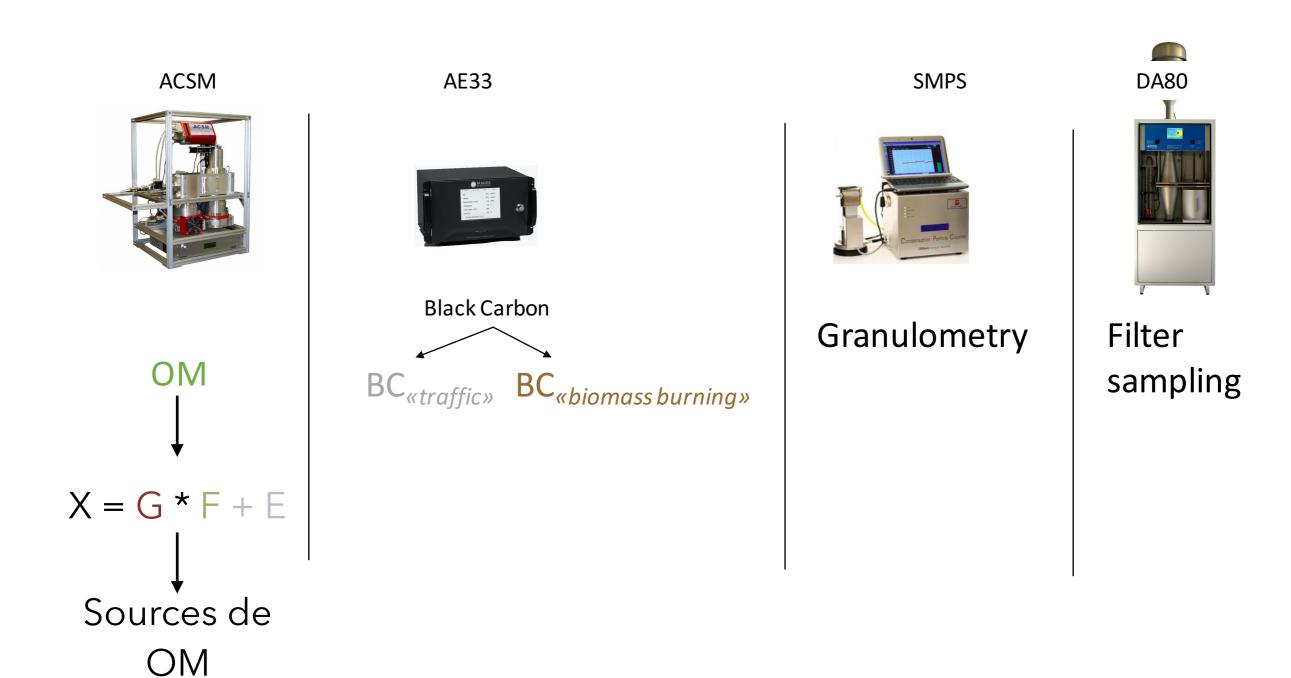

SMPS

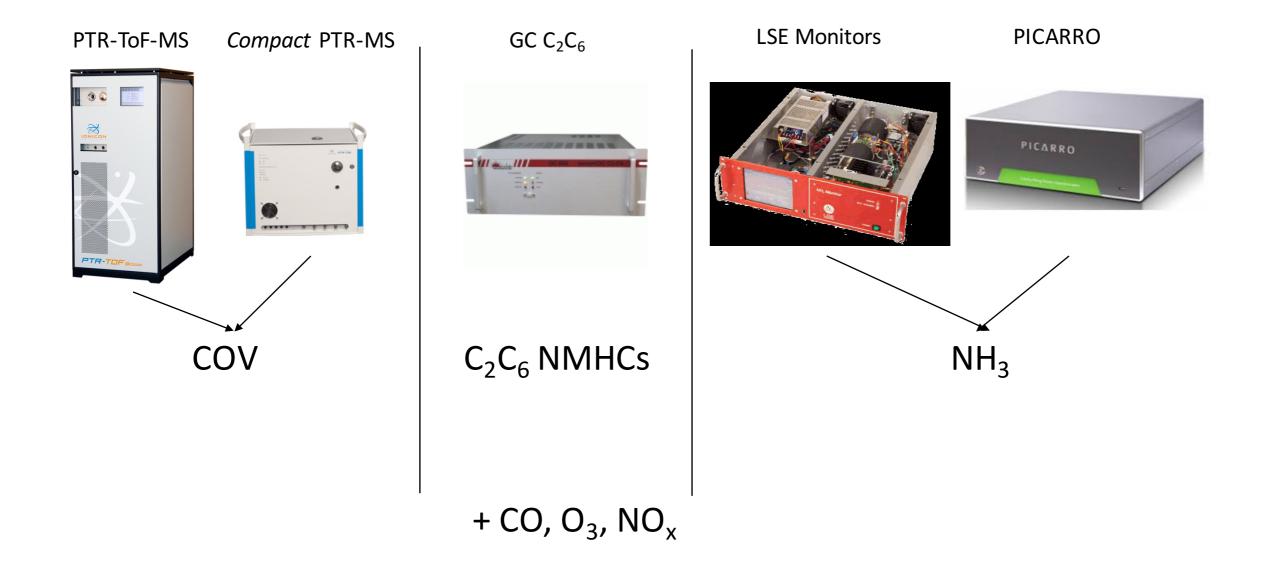

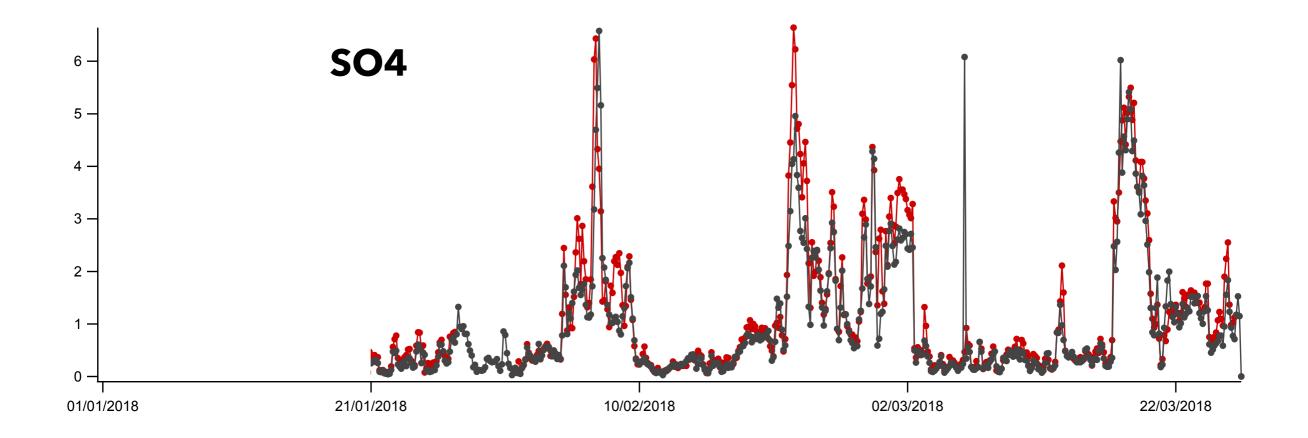

Granulometry

Filter sampling

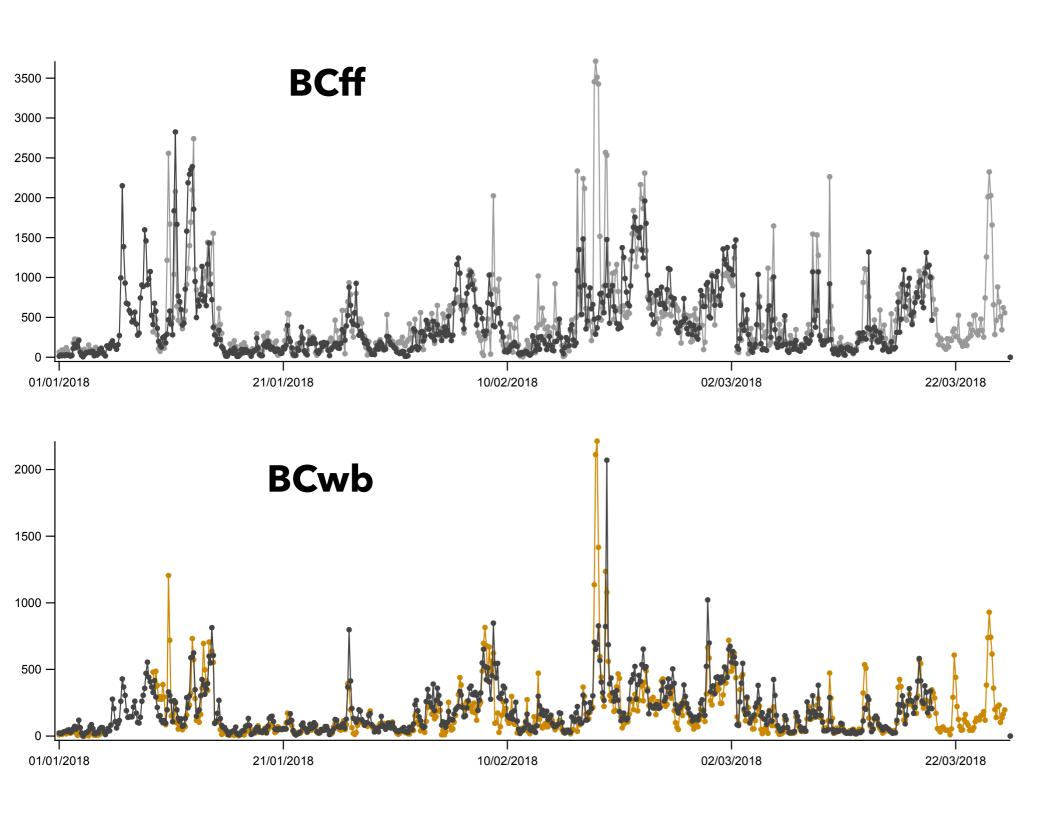

In IdF, SO4 should be homogeneous -> YES!

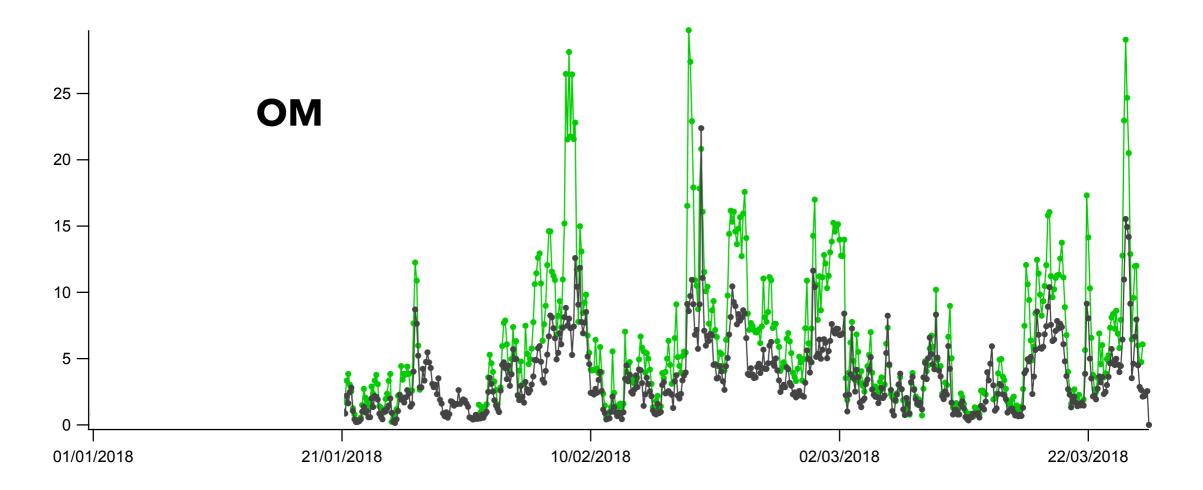

Validation de la calibration des ACSM. Toute différence observée est atmosphérique

Surpringly, BCff & BCwb are very similar at both sites

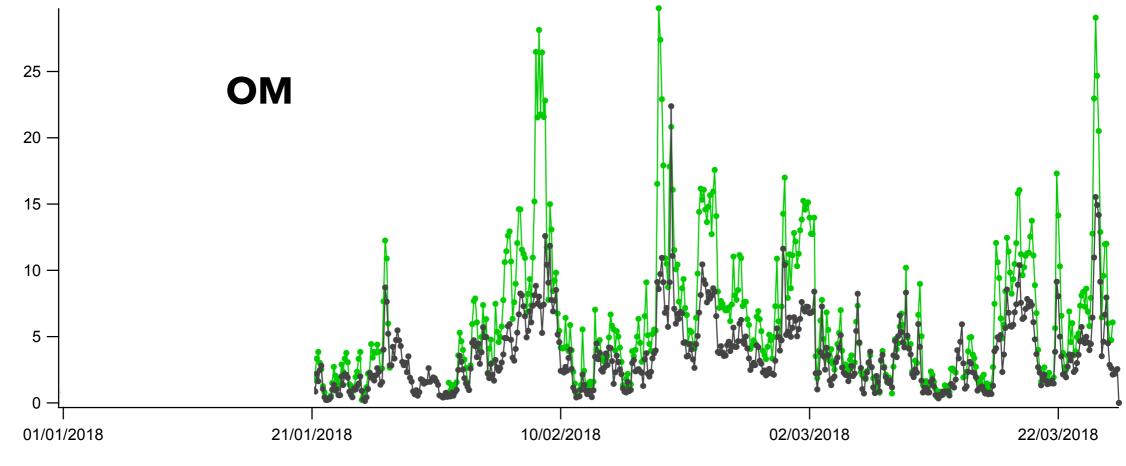

Similar emissions? Homogeneous signal over 50-60km?

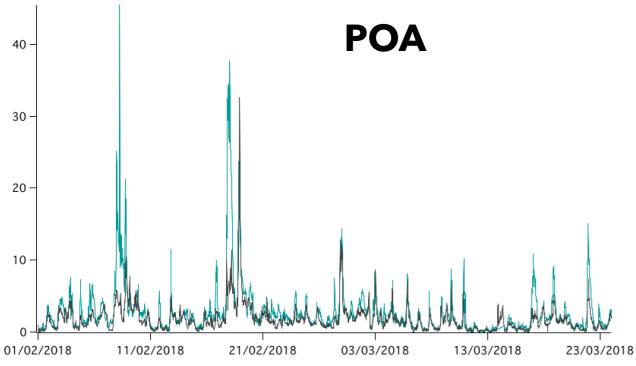

If $BC_{grignon} = BC_{SIRTA}$, then we could estimate that $POA_{grignon} = POA_{SIRTA}$

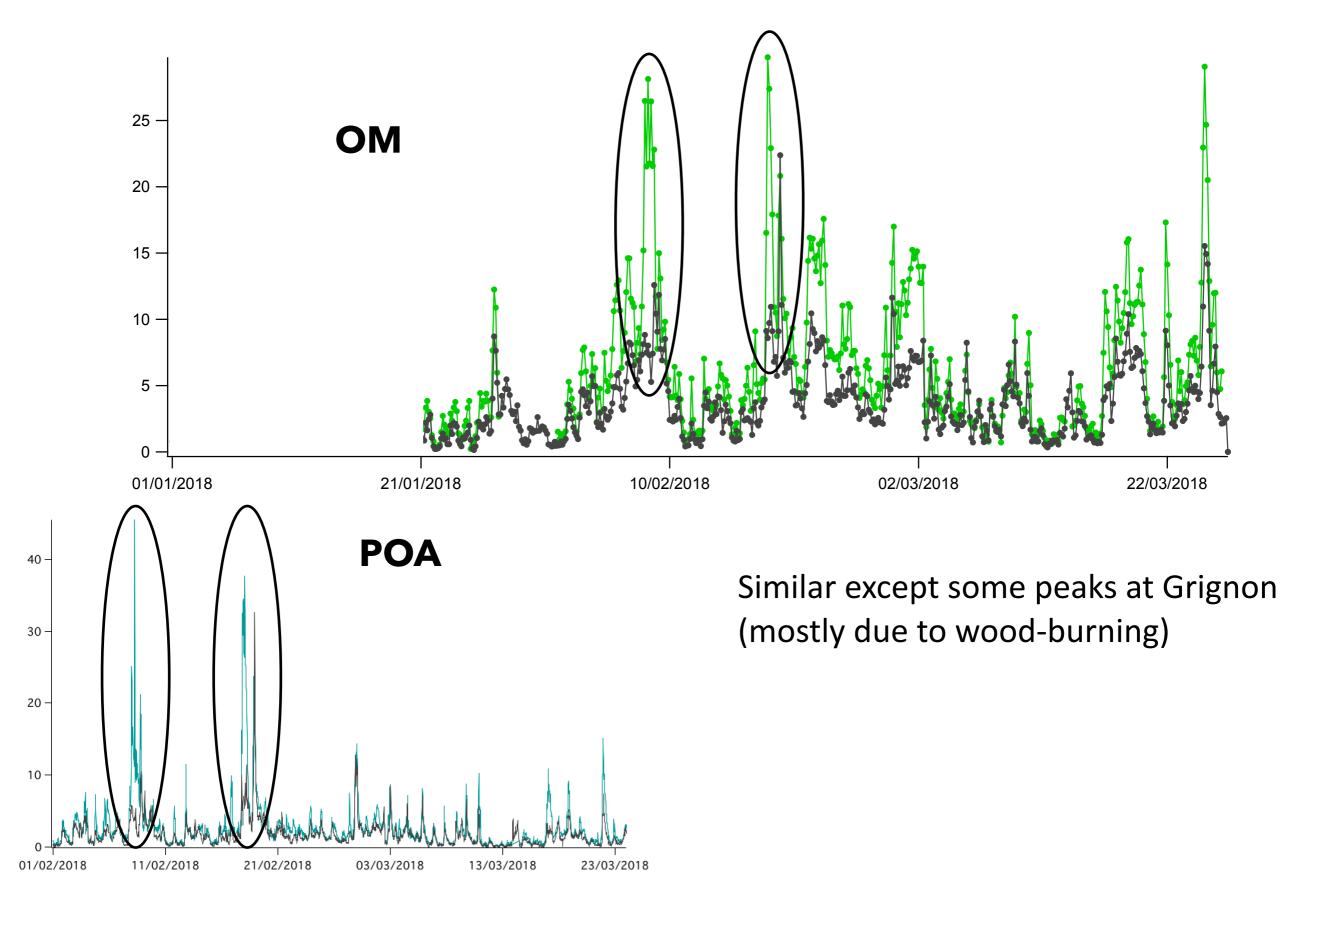

OM higher at Grignon -> Primary or secondary, <u>could it be the signature of agricultural activities?</u>

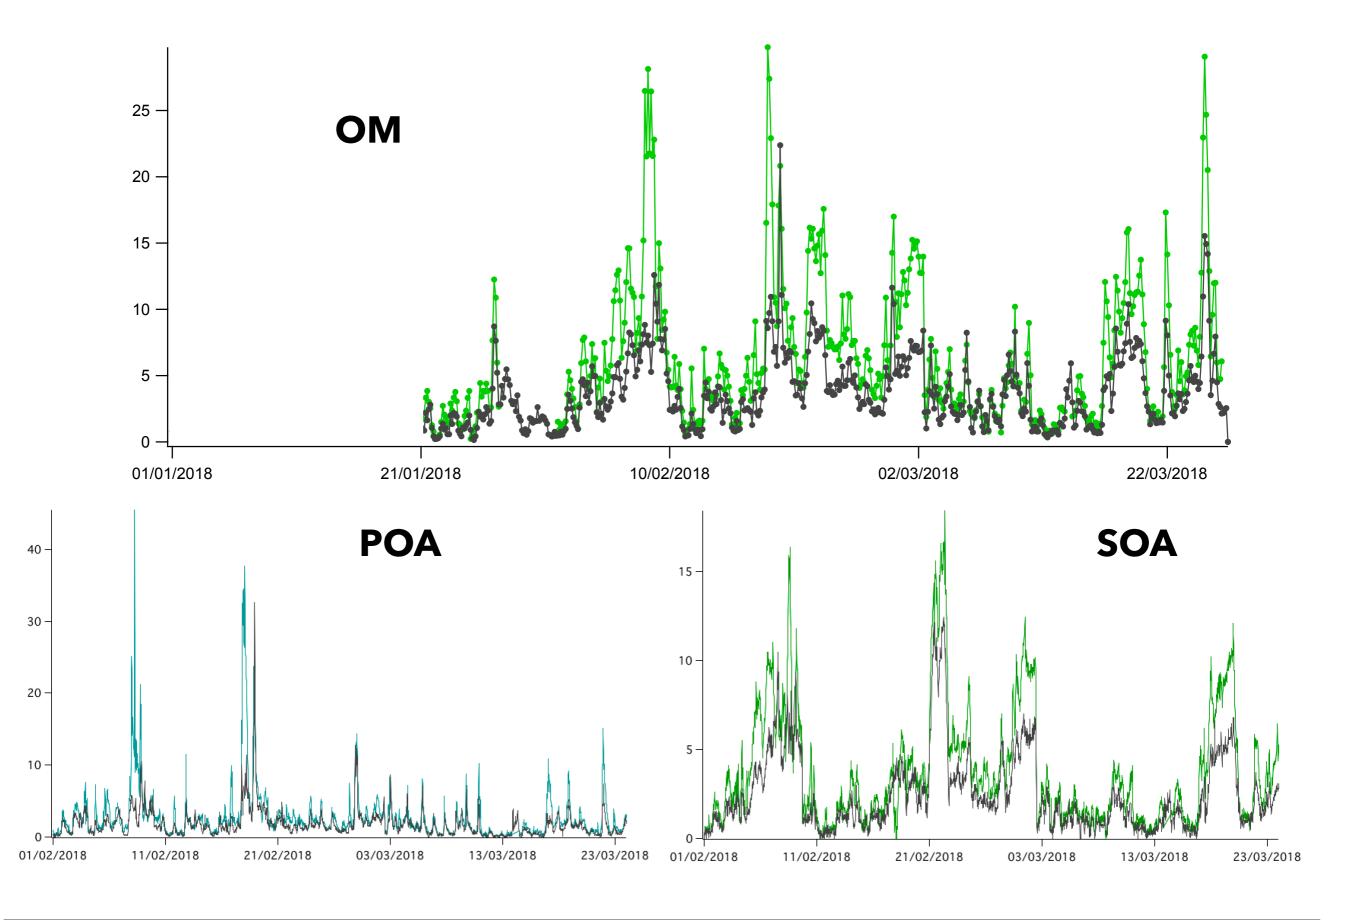

Statistical analysis needed in order to compare the different fractions of OM

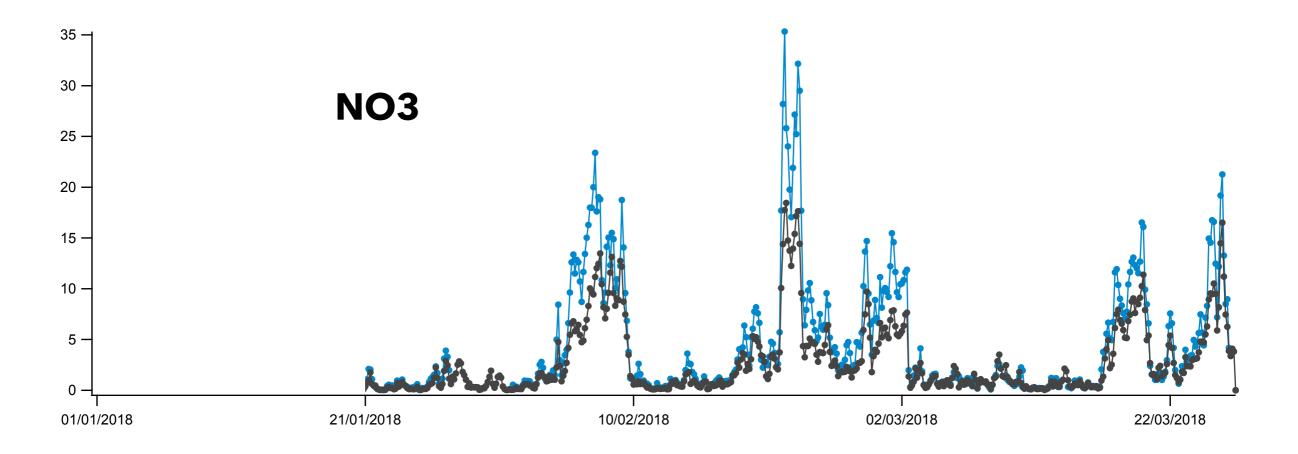

Similar except some peaks at Grignon (mostly due to wood-burning)

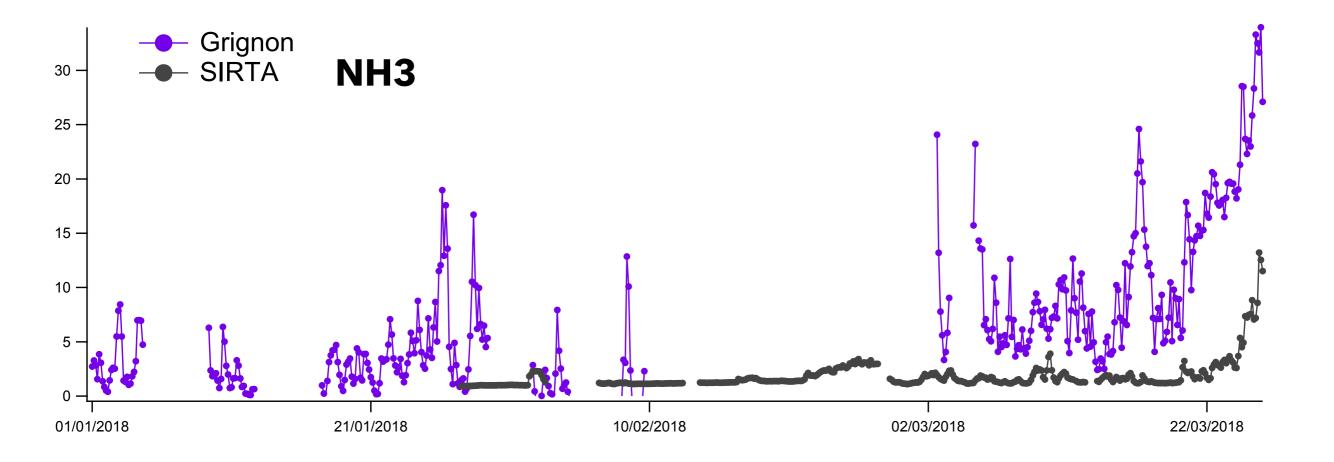

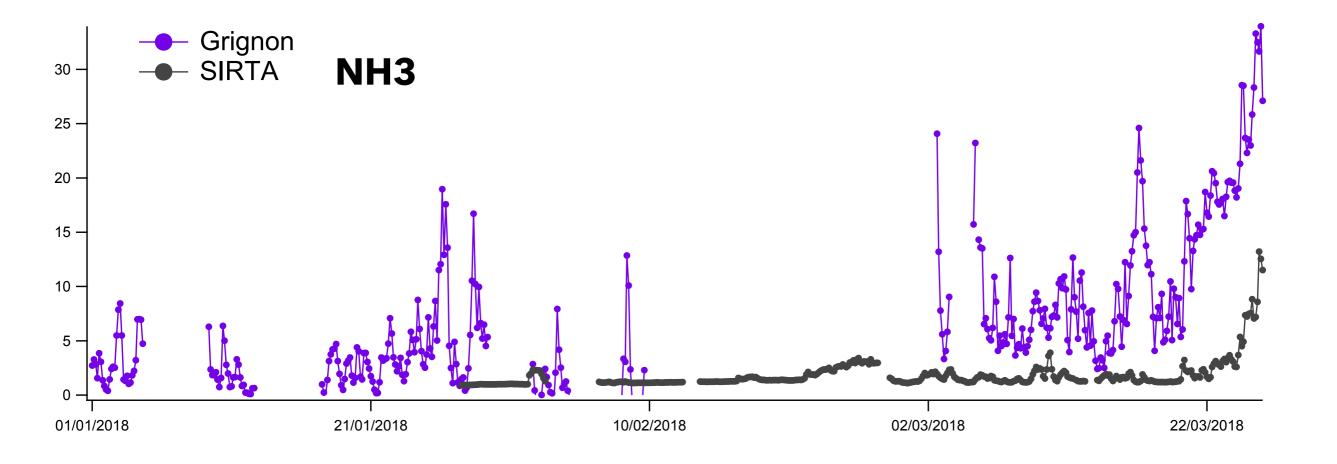

More NO3 at Grignon during peaks!

-> more NH3 available to form SIA?

NH3 concentrations much higher in Grignon

Agricultural areas = reservoir of secondary pollution?

NH3 concentrations much higher in Grignon

Agricultural areas = reservoir of secondary pollution?

Thermodynamic (eg ISORROPIA) and model evaluation

More to come soon...

Merci de votre attention
